

AutoTraQ Feature Showcase

A browser-based inventory command center for automotive parts teams

100+
practical features

Inventory, fitment, barcode scanning, requests, alerts, audit logs, reports, and admin controls in one shared web platform.

LIVE PRODUCT AREAS

Parts Catalog

Why Web Production Wins

The product is stronger as a hosted web app than as a copied desktop installer.

No installers

Clients open a URL, log in, and work from any approved browser.

One source of

truth. Inventory, users, scans, and requests all share the same production database.

Instant

updates. Deploy once, every client computer gets the current version automatically.

Client onboarding becomes simple: account + website URL + role.

AUTOTRAQ

The Platform in One View

AutoTraQ connects the core operations a parts team repeats every day.

Parts + Images

Vehicle Fitment

Parts Catalog + Vehicle Fitment

The catalog is built around real automotive lookup needs, not generic warehouse items.

Every part carries the details that matter

SKU, name, condition, min stock, cost, retail price, OEM flag, part type, barcode data, images, and vehicle compatibility.

Example Part Detail

SKU **BRK-001**

Condition **GOOD**

Fits **2000 Honda Civic EX**

Barcode 

Inline editing, image gallery, stock add, fitment attach, and interchange membership.

Inventory Movement Is Traceable

Stock is not just overwritten. AutoTraQ records inventory as events.

Receive

Fulfill

Return

Correct

Each action creates an inventory event with part, location, quantity change, user, timestamp, and reason.

Result: managers can explain exactly why stock changed, who changed it, and when it happened.

Request Workflow

Part requests move through an approval and fulfillment process instead of informal messages.

Create

Pending

Approve

Fulfill

Audit

Multi-item requests, manager approvals, fulfillment permissions, cancellation, scan-to-fulfill, and request-level audit details.

This turns parts movement into a controlled workflow instead of a paper trail.

Barcode Scanning + Analytics

Scanning makes warehouse work faster and gives managers visibility into real activity.

Scan Methods

- Camera scan
- USB scanner
- Manual SKU entry
- Barcode login

Scan Actions

- Lookup parts
- Navigate records
- Fulfill requests
- Track success

Analytics

- Most scanned parts
- Most active users
- Peak scan hours
- Scan frequency

Operational Intelligence

AutoTraQ does more than store inventory. It helps teams decide what needs attention.

Low-stock alerts

Detect parts below minimum stock and surface them on the dashboard.

Reorder management

Prioritize critical, high, medium, and low reorder needs using usage history.

Predictive views

Estimate days until restock, usage trends, and risk signals.

Managers see problems before they become stockouts.

Admin, Security, and Accountability

Every user gets the right access level, and important actions leave a record.

Roles

Admin
Manager
Fulfillment
Viewer

Admin Console

Create users
Reset passwords
Approve roles
Manage pricing

Audit Trail

Who acted
What changed
When it happened
Which record

Imports, Exports, and Reports

The system supports real onboarding and real reporting needs.

CSV

Bulk import/update parts and export inventory data for handoff or analysis.

PDF

Generate full inventory and low-stock reports for managers.

API

Backend routes cover parts, vehicles, inventory, requests, scans, reports, and admin workflows.

Useful in a demo, but also practical when a client brings existing spreadsheet data.

Technical Foundation

Modern web stack, production deployment path, and automated quality checks.

React + Vite + TypeScript

Express API + Zod

MySQL + Prisma

Railway Deploy

Production readiness includes security headers, compression, CORS controls, schema deployment, and CI checks.

This supports the web-only direction: reliable deploys instead of computer-by-computer installation.

Best Live Demo Path

A short demo can show the whole product without overwhelming the room.

- 1 Login + dashboard**
- 2 Search a part by SKU or vehicle fitment**
- 3 Open part detail: images, barcode, fitments, stock, pricing**
- 4 Scan or enter a barcode**
- 5 Create, approve, and fulfill a request**
- 6 Show inventory changed, then prove it in audit logs**
- 7 End on reorder management and low-stock intelligence**

What AutoTraQ Proves

This is not just a class project interface. It is a working operations platform.

One website can run the parts counter, warehouse, manager dashboard, scan station, and audit trail.

Client value: fewer missing parts, faster lookups, cleaner accountability, and simpler onboarding.
